### **Cooperating with**

U. S. Department of Agriculture  
Statistical Reporting Service

### **Acknowledgment**

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida as shown in this summary are official estimates of the Florida Crop and Livestock Reporting Service. Corresponding data for other citrus states are from official reports of the USDA, Statistical Reporting Service. Canned and frozen pack statistics were compiled by the Florida Citrus Processors Association. Where data are from other sources, appropriate references appear.

Records of the Division of Fruit and Vegetable Inspection, Florida Department of Agriculture and Consumer Services, were employed in production and utilization estimates. The Citrus Administrative Committee assisted in assembling these data.

Many producers, shippers, canners, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The report was assembled under the direction of James W. Todd and Robert R. Terry of the Florida Crop and Livestock Reporting Service.

## FLORIDA WEATHER HIGHLIGHTS, SELECTED AREAS AND MONTHS, 1984-85 CROP YEAR

For the second consecutive season, Florida citrus growing areas experienced a major freeze. The below freezing temperatures in December 1983 followed by the January 1985 freeze produced the worst tree loss of this century. Many trees that were left in a weakened condition following the December 1983 freeze were killed by the freezing temperatures on January 21-22, 1985.

January and February 1984 temperatures were moderately cool, with bloom occurring mid-March to mid-April. Even the northern counties where heavy defoliation had occurred following the Christmas 1983 freeze, flushed out new growth and set a reasonably good spring bloom. Rainfall was mostly adequate throughout the spring with only slight moisture deficits preceding the usual summer rains which began in late June. Good growing conditions prevailed and many trees damaged by the cold began to flush out new growth.

By late summer, rainfall had moderated seasonally and growers were forced to start irrigation to maintain adequate soil moisture. An early October cool front moved through the State, but with only small amounts of rainfall. Slight leaf wilt was still occurring in some areas and the need for irrigation continued.

Scattered rainfall and moderate temperatures marked November weather, with growers irrigating where possible and cool nights and warm days promoting color break on most citrus types.

December temperatures were generally above normal levels except for the eighth and ninth when a cold front moved through the State. There was some scattered leaf burn when temperatures dipped to below 30 degrees in a few central and north central spots. The absence of rain throughout the rest of the month slowed tree growth and helped promote semi-dormancy.

On January 5 - 6 a cold front brought freezing temperatures to central growing areas and again on the 12th and 13th temperatures dipped to the low 30's. The coldest temperatures, however, occurred on the 21st and 22nd when a hard freeze occurred in most areas of the State except the extreme lower portion. Temperatures in the high teens were recorded in the northern citrus counties. Readings were the coldest in pockets and low ground areas. Lows in the teens and low 20's killed many trees along the upper most producing counties from Pasco through Lake, Orange and Volusia and northward that had been weakened by the December 1983 freeze. Considerable tree loss also occurred in north Brevard, Osceola, Polk, and Hillsborough counties. The lower East Coast reported the fewest hours below 28 degrees but considerable defoliation occurred in all areas. Low 20 degree readings in some Martin County locations caused severe defoliation and killed trees that were in a weakened or declining state.

The week following the hard freeze was very cold which slowed dehydration of damaged fruit. February continued with just moderately cool temperatures, except for the period from the 9 - 15 when sub-freezing weather invaded the citrus belt, bringing heavy frost but little damage. Rainfall was light and many growers irrigated to stimulate new growth and bloom bud formation.

March weather had warm daytime temperatures with very little rainfall until late in the month, when on the 21st and 22nd most areas received up to 3 inches preceding a cool front that dropped temperatures into the 40's and low 50's.

April temperatures were generally cooler than normal with showers occurring on a regular basis. However, growers continued to irrigate to avoid leaf wilt on trees flushed with new growth.

## 1984-85 PRODUCTION AND TREE CENSUS

### PRODUCTION

Florida's season began with bloom occurring mostly in the last three weeks of March and the first week of April. Fruit set was variable because of the effects of the previous December freeze. Most trees in the northern areas set varying amounts of fruit.

The initial October forecast of 119 million boxes of oranges was up slightly from the previous season's December freeze reduced harvest of 116.7 million boxes. Final harvest was again reduced by the freeze on January 21 and 22, 1985 and 103.9 million boxes were utilized.

Grapefruit harvest was 41.1 million boxes. Virtually no grapefruit was set in the Upper Interior or upper portions of Polk County so only moderate amounts were lost. East Coast growing areas, which have the greatest portion of the crop, suffered slight losses but a higher portion of the total grapefruit went to processing than normal.

Specialty crop production was also reduced from previous seasons except for Tangelos which were unchanged and limes which increased. No freeze damage or loss was reported for limes in Dade County.

FCOJ final yield for all oranges was 1.37582 gallons per box with early-mids at 1.39083 and Valencias at 1.35988.

California's orange production of 52,000,000 boxes was slightly above the previous season's 48,500,000 boxes, but 32 percent less than 1982-83 production of 76,100,000 boxes. Grapefruit production was 7,900,000 boxes, up from 7,240,000 the previous season. Lemon production was up slightly but tangerine production was down.

Arizona orange production was 2,450,000 boxes, up from 1,800,000 boxes but still less than the record high 1982-83 production of 3,800,000 boxes. Both grapefruit and lemon harvests were higher than the past two seasons.

Texas citrus trees were devastated by the December 1983 freeze and no commercial citrus was produced during the 1984-85 season. Tree losses were very heavy from that freeze and the following freeze in January 1985. Only limited amounts of fruit can be expected in coming seasons.

### TREE CENSUS

The Florida Crop and Livestock Reporting Service first began indexing the State's commercial citrus groves on aerial photography as of January, 1966. Ground crews in 4-wheel drive vehicles identify all the State's groves by year in which set, fruit type, and row spacing. Photo interpreters in the Orlando office then delineate the groves by variety blocks on positive photo transparencies at a scale of 1 inch to 660 feet. Variety blocks are measured with planimeters to obtain acreage and then indexed by land section.

The inventory was designed for quick and economical updating. Since 1966, the production area has been resurveyed each second winter--1968 through 1984--to determine changes. Photographing begins in November when weather conditions are most favorable and is generally completed in 80 to 90 days. The same three-mile-wide flight lines established in 1966 are photographed on each succeeding flight. Approximately 14,000 square miles of photography is obtained at a 1 to 30,000 scale.

The last statewide survey was conducted as of January 1984, immediately following the severe freeze that came through the production area on Christmas 1983. The northern one-third of the citrus belt was devastated, rendering field enumeration very difficult. For that reason, a 14 county area was sampled for an aggregate count, with the expectation of conducting a resurvey when conditions improved.

A special survey in the 14 counties most severely affected was conducted in the spring and summer of 1985 and shows 118,509 fewer acres of citrus than were reported a year earlier. Total acreage remaining viable in the 14-counties, excluding 1984 and 1985 trees set is 58,973 acres, down from 177,482 acres in 1984 and 277,536 acres in 1982.

Photography for the 1986 survey began in November 1985 and field work has begun in all areas. Updated tree numbers and acreages will be available in late summer 1986.

### FLORIDA, ALL CITRUS: Acres in commercial groves as of January, 1966 - 1984, with percent changes

Year	Acres	Change from previous survey	Change from 1966 survey
		Percent	
1966	858,082	—	—
1968	931,249	+8.5	+8.5
1970	941,471	+1.1	+9.7
1972	878,019	-6.7	+2.3
1974	864,098	-1.6	+0.7
1976	852,369	-1.4	-0.7
1978	831,235	-2.5	-3.1
1980	845,283	-1.7	-1.5
1982	847,856	+0.3	-1.2
1984	761,365	-10.2	-11.3

## 1984-85 VALUE OF SALES, PRICES AND EXPORTS

### VALUE

The preliminary on-tree value of all citrus for the 1984-85 season is a record high \$1,044,821,000. This is 23 percent more than the 1983-84 revised season total of \$849,457,000 and slightly more than the previous record high 1979-80 season total of \$1,037,050,000.

Preliminary value is based on that part of the crop that was priced at harvest, about 30 percent of the total. When all participation plans and cooperative prices are finalized, a revised value is calculated.

The preliminary 1984-85 on-tree price of oranges was \$7.75 per box, up from the 1983-84 season revised price of \$5.75. Both fresh and processing prices were the highest of record reflecting the reduced crop size caused by the Christmas 1983 and January 1985 freezes. Early and midseason varieties returned \$7.82 per box while Valencias returned \$7.68 per box. Early-mids for processing returned \$7.47 per box, up from last season's revised \$4.96. Valencias for processing returned \$7.59 per box, up from \$6.55 the previous season.

Grapefruit prices were higher than revised previous season prices for all types and all methods of utilization. Fresh colored varieties returned \$6.58 per box compared with the previous season's \$5.25 per box. All processing returns were \$2.28 compared with \$1.70 the previous season.

All other types of citrus except limes and lemons provided higher returns per box reflecting reduced crop sizes because of the 1983 and 1985 freezes.

The 1984-85 season average delivered-in value for all priced fruit at processing plants going into FCOJ was \$9.38 per box or \$1.66 per pound of solids. Early-mids averaged \$9.40 per box and \$1.66 per pound solids and Valencias averaged \$9.37 per box and \$1.65 per pound.

### FLORIDA, ALL CITRUS: Value of sales on-tree, crop years 1975-76 through 1984-85

1/ Revised. 2/ Preliminary.

### COUNTY PRODUCTION

Estimates of citrus production by counties were prepared from objective survey data obtained from the citrus crop estimates program. Production for Florida has been distributed to counties based on the biennial citrus tree census, limb count survey data adjusted for droppage to end of season, and size data at maturity.

Tree numbers by county which are used in the estimates were obtained from the latest tree census. Data on production are obtained from several objective fruit surveys: limb count and size and droppage samples. Because of the statistical sampling design, counties with higher production in general have a greater number of fruit samples, and therefore estimates for these counties can be considered more reliable. Thus, for the same reason, estimates for the production areas are still more reliable.

### PRICES

All on-tree prices represent the average price received by growers for their fruit by types. Prices are based on records of commercial fresh fruit and processed fruit returns. The term "on-tree" relates to fruit value before it is picked and hauled from the grove. Each season, beginning with the first month that three percent of a fruit type is harvested, monthly estimates are computed. Fresh fruit sales organizations and a mail-out questionnaire to packers provide the average F.O.B. price, and processors supply an average spot and cash price for fruit delivered to plants. From these values, an estimated charge for picking, hauling and packing is deducted to arrive at an on-tree price. The anticipated box utilization for the month is used to combine the fresh and processing price to obtain an average price for all methods of sales. At the end of the season, monthly price averages are computed and weighted by boxes utilized, to provide the preliminary season average price.

A year later, after most processed products are sold, cooperatives and firms with participation plans report prices of fruit they handled. These prices, combined with the spot and cash prices collected earlier, are weighted together, by varieties, to determine the final processing price received by growers. From this price, charges for picking, hauling and packing, as determined by University of Florida economists, are deducted to arrive at the final on-tree price received by growers.

### FOREIGN EXPORTS

Fresh citrus exports to countries other than Mexico and Canada were greatly reduced this season primarily because of the freezes and the citrus canker threat. Grapefruit exports, especially to Japan, were off sharply. Japan received only 2,563,000 cartons compared with 6,242,000 the previous season. Total orange exports were only 10,000 cartons and no specialty citrus was exported.

There were 10.9 million gallons of FCOJ exported in the 1984-85 season. This compared with 12.8 million gallons exported last season. Canada is the major market for U.S. exports. There were 3.2 million gallons of concentrated grapefruit juice exported this season.

#### History of Florida's Citrus Industry

The citrus tree is a native of the Orient. From this area it was carried ever westward by man, to India, to the Mediterranean and on across the Atlantic. Citrus was brought to the Americas by Columbus. When he landed on November 22, 1493, he brought citrus seeds that were planted on the island of Haiti. The first seeds planted on the mainland of the Americas were brought by the expedition of Juan de Grijalva when he landed in Central America between July 12 and July 20, 1518. The exact date of the introduction of citrus trees into Florida is not known, but from a statement made by Pedro Medendez, dated April 2, 1579, it appears that citrus fruits were grown in abundance around St. Augustine at that time. Early settlers in Florida some two centuries later found wild citrus trees scattered over the State. One of the oldest, cultivated groves planted in Florida (Hume, 1926 p.95) is thought to have been the Don Phillippe grove in Pinellas County, planted sometime between 1809 and 1820.

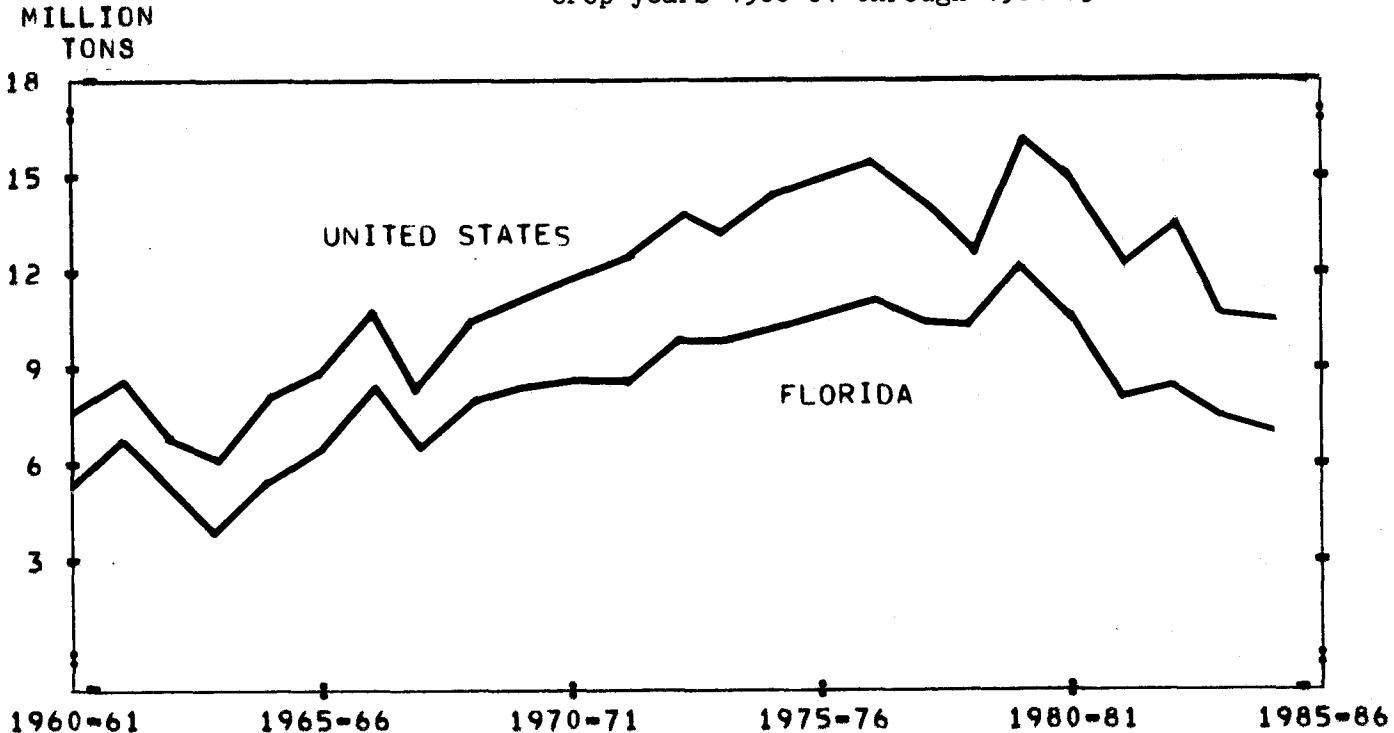

Citrus production in Florida had reached an all time high of more than 5 million boxes when the Great Freeze of 1894-95 almost totally wiped out the citrus industry. It was not until 1909-10 that this level was reached again. Since that time the volume steadily increased. In 1984-85, Florida had 68.8 percent of the Nation's production.

Footnote 2/ for page 32, 1/ for pages 33 and 34. Final Mexican shipments to the U. S. are reported by FAS as a combined total for oranges and tangerines. The total shown on pages 32 through 34 has been broken down proportionally into oranges and tangerines from Plant Quarantine data reported at the time of the crossing. Plant Quarantine releases give separate totals for these two types of citrus. Mexican shipments, through the U.S. to Canada are not included.

ORANGES, TANGELOS AND TEMPLES: Total fresh shipments exported by States of origin,
